Annoyances with spreadsheets

- Many standard methods in statistics are not available. Other methods only offer basic options (linear regression)
- Different analysis require user to reorganize the data
- Probably ok for simple calculations (basic summary statistics, simple regression)
- Add-ons can be used for missing functions (e.g. StatPlus for Excel)
- Many types of graphics violate standards of good graphics

Annoyances with spreadsheets

Mistaken Identifiers: Gene name errors can be introduced inadvertently when using Excel in bioinformatics

[Barry R Zeeberg](#), [Joseph Riss](#), [David W Kane](#), [Kimberly J Bussey](#), [Edward Uchio](#), [W Marston Linehan](#), [J Carl Barrett](#) & [John N Weinstein](#) 

BMC Bioinformatics **5**, Article number: 80 (2004) | [Cite this article](#)

116k Accesses | **45** Citations | **549** Altmetric | [Metrics](#)

The screenshot shows a Microsoft Excel spreadsheet with the following data:

	A	B	C	D
1		Original name	As converted by Excel	Other possible conversion
2	Gene name	SEP2	sept.02	2-sep
3	Riken identifier	2310009E13	2.31E+19	
4				
5				

“The date conversions affect at least 30 gene names; the floating-point conversions affect at least 2,000 if Riken identifiers are included. These conversions are irreversible; the original gene names cannot be recovered.”

Example of a dataset which is difficult to use with any statistical program

BMDP	Statistical Solutions		No	Proprietary			

What is R ?

- R is an open source complete and flexible software environment for statistical computing and graphics.
- It includes :
 - Tools for data import and manipulation
 - Large set of data analysis tools
 - Graphical tools
 - As a programming language, a simple development environment, with a text editor
- R itself is written primarily in C and Fortran, and is an implementation of the statistical language S

Why R ?

- R has become the tool of choice for statistical analysis in several fields, including life sciences
- Two reasons for this success: it is free and many contributed packages are available (can be installed and run directly from R).
- Well-designed publication-quality plots can be produced, including mathematical symbols and formulae where needed.
- Many tools implemented for bioinformatics

Advantages of R

- Advantages of R
 - Availability and compatibility
 - State-of-the-art graphics capabilities
 - Can import files from other (statistical) programs
 - New version every x months
 - Interactive development environments (IDEs) available
 - Large users community
- Advantages of *learning* R
 - Learn to program and do reproducible research
 - Speak the common language

Drawbacks of R

- «Expert friendly»
 - Learn by example
 - Not very (easily) interactive
 - Command-based
 - Documentation sometimes cryptic
-
- (Too) large amount of resources
 - Constantly evolving
 - Memory intensive and slow at times

The R Project for Statistical Computing

Getting Started

R is a free software environment for statistical computing and graphics. It compiles and runs on a wide variety of UNIX platforms, Windows and MacOS. To [download R](#), please choose your preferred [CRAN mirror](#).

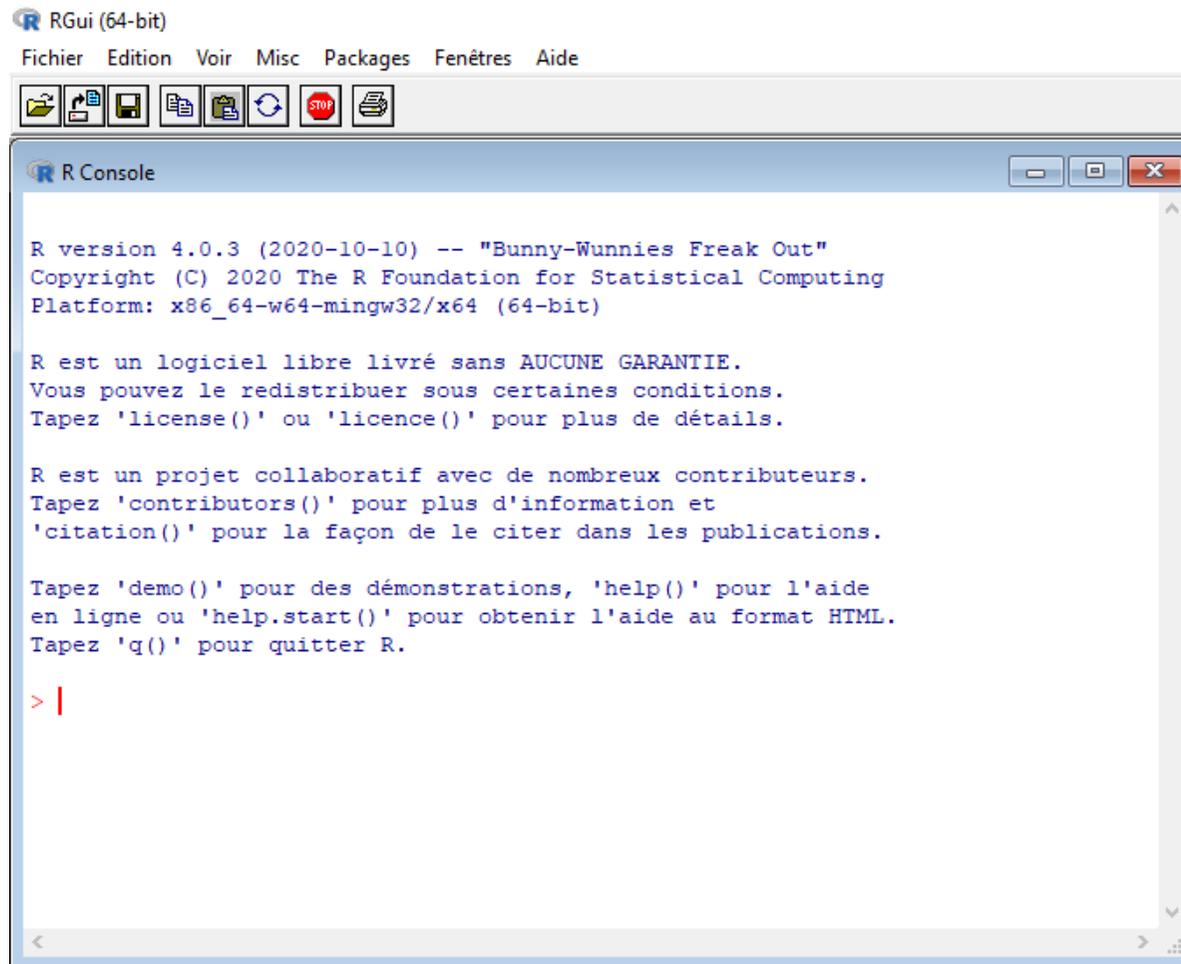

If you have questions about R like how to download and install the software, or what the license terms are, please read our [answers to frequently asked questions](#) before you send an email.

News

- **R version 4.0.4 (Lost Library Book) prerelease versions** will appear starting Friday 2021-02-05. Final release is scheduled for Monday 2021-02-15.
- **R version 4.0.3 (Bunny-Wunnies Freak Out)** has been released on 2020-10-10.
- Thanks to the organisers of useR! 2020 for a successful online conference. Recorded tutorials and talks from the conference are available on the [R Consortium YouTube channel](#).
- **R version 3.6.3 (Holding the Windsock)** was released on 2020-02-29.
- You can support the R Foundation with a renewable subscription as a [supporting member](#)

The prompt “>” indicates that R is waiting for you to type a command

RStudio interface

The image shows the RStudio interface with four red arrows pointing to specific components:

- Editor:** Points to the script editor window containing R code for a one-sample t-test simulation.
- Console, terminal:** Points to the console window showing the execution of the code and resulting output, including warning messages about deprecated functions.
- Workspace, history:** Points to the Environment pane, which displays the current workspace variables: `weight` (12 observations), `mean_weight` (29.6915933333333), and `sd_weight` (2.08078056863429).
- File explorer, plots, packages, help:** Points to the Plots pane, which displays a boxplot of the `weight` variable. The y-axis is labeled "Weight (g)" and ranges from 27 to 32. The plot shows a distribution with a median around 29.8g and several outliers.

```
13
14
15 # -----
16 # one sample t-test
17 # -----
18
19 # weight <- runif(12, min=26, max=33)
20 weight <- c(31.89381,28.45898,28.18985,30.06679,27.04369,32.30934,
21            31.52805,32.28462,27.25366,29.64034,30.74083,26.88916)
22 weight <- as.data.frame(weight)
23
24 mean_weight <- mean(weight$weight)
25 sd_weight <- sd(weight$weight)
26
27 hist(weight$weight, main="Mice weight at 18 weeks", xlab="")
28
29 ggboxplot(weight$weight, width = 0.5, add = c("mean","jitter"), ylab =
30 "weight (g)", xlab = F)
31 identify_outliers(weight)
32
33 <
```

Console output:

```
> sd_weight <- sd(weight$weight)

R scripts and workspace

- R script (.R file)
 - Very useful instead of typing commands on the console.
 - Allows you to keep track of what you are doing and make any modification easier
 - To actually execute some commands, you can select the lines and run the execution
- Workspace (.Rdata file)
 - The internal memory where R will store the objects you created during the session.
 - To list what is in your workspace: `ls()`
 - To empty the workspace from all objects: `rm(list=ls())`
 - To save only specific R objects: `save(object_name(s), "name_of_file.RData")`
 - To save your entire workspace: `save.image("name_of_file.RData")`
 - To load your workspace: `load("name_of_file.RData")`

R Markdown

- R Markdown provides an authoring framework for data science. You can use a single R Markdown file to both:
 - save and execute code
 - generate high quality reports that can be shared with an audience
- R Markdown documents are fully reproducible and support dozens of static and dynamic output formats

<https://rmarkdown.rstudio.com/lesson-1.html>

A .Rmd file

YAML metadata

```
---  
title: "Topographic Data in R"  
author: "Eric Pante, Benoit Simon-Bouhet and Jean-Olivier Irissou"  
output: html_document  
params:  
  dataset: "Florida"  
---
```

Text

marmap is a package designed for downloading, plotting and manipulating bathymetric and topographic data in R.

Code chunks

```
## [r setup]  
library(marmap, warn = FALSE)  
library(ggplot2, warn = FALSE)  
library(viridis, warn = FALSE)  
  
data(list = params$dataset)  
df <- fortify(get(params$dataset))  
  
p <- ggplot(df, aes(x=x, y=y)) +  
  geom_raster(aes(fill=z)) +  
  geom_contour(aes(z=z), colour="white", size=0.1,  
    breaks=c(-100, -200, -500, -1000, -2000, -4000)) +  
  geom_contour(aes(z=z), colour="white", size=0.3, breaks=0) +  
  theme_void() +  
  coord_fixed()  
...
```

Using Topographic Colors

Leaving R

- To leave R, use the `q()` command (or "quit" from the menu in RStudio):

```
> q( )
```

```
Save workspace image? [y/n/c]:
```

Answers:

y save workspace image

n **don't save workspace image**

c cancel quitting

Functions, operators and variables

```
CIhigh <- mean(x) + 1.96*sd(x)/sqrt(n)
```

Variables: objects stored in memory

Functions: always followed by parenthesis

Operators

R syntax

- Case sensitive: A is not a
- Variable names can include A-Z, a-z, 0-9, but can not start with a number
- Commands can be separated by ; or newline

```
> x <- 2; x+2
```

```
[1] 4
```

- # indicates comments:

```
> maxvalue <- 2 # Data above two is not relevant
```

R help

```
> ?sum # equivalent to help(sum)
```

```
sum {base}
```

R Documentation

Sum of Vector Elements

Description

`sum` returns the sum of all the values present in its arguments.

Usage

```
sum(..., na.rm = FALSE)
```

Arguments

`...` numeric or complex or logical vectors.

`na.rm` logical. Should missing values (including `NaN`) be removed?

Using R as a calculator

```
> 2*3
```

```
[1] 6
```

```
> log(6)/2^2
```

```
[1] 0.4479399
```

```
> exp(6)-4
```

```
[1] 399.4288
```

```
> pi-3
```

```
[1] 0.1415927
```

Using R as a programming language

```
> x <- 2.0
```

```
> x
```

```
[1] 2.0
```

```
> y = 3.0 # Equivalent to y <- 3.0
```

```
> y; x
```

```
[1] 3
```

```
[1] 2
```

```
> 1/x
```

```
[1] 0.5
```

Creating vectors using the c() command

```
> x <- c(1.3, 0.32, 10.5, 5.9, 6.3)
```

```
> x
```

```
[1] 1.30 0.32 10.50 5.90 6.30
```

```
> y <- c(x, 1.4, x, x); y
```

```
[1] 1.30 0.32 10.50 5.90 6.30
```

```
[6] 1.40 1.30 0.32 10.50 5.90
```

```
[11] 6.30 1.30 0.32 10.50 5.90
```

```
[16] 6.30
```

Vector operations

Vector operations work element by element:

```
> x <- c(1.3, 0.32, 10.5, 5.9, 6.3)
```

```
> y <- x*2; y
```

```
[1] 2.60 0.64 21.00 11.80 12.60
```

```
> z <- x*y; z
```

```
[1] 3.38 0.21 220.50 69.62 79.38
```

Recycling

- If a vector is too short, R recycles it (reuses it) as needed:

```
> x <- c(1.3, 0.32, 10.5, 5.9)
```

```
> y <- c(2, 10)
```

```
> x*y
```

```
[1] 2.6 3.2 21.0 59.0
```

```
1.3*2 0.32*10 10.5*2 5.9*10
```

- A warning message is displayed if the shortest vector can not be recycled entirely:

```
> x <- c(1.3, 0.32, 10.5, 5.9, 6.3)
```

```
> x*y
```

```
[1] 2.6 3.2 21.0 59.0 12.6
```

Warning message:

In x * y :

longer object length is not a multiple of shorter object length

Generating sequences of numbers

```
> 1:10
```

```
[1] 1 2 3 4 5 6 7 8 9 10
```

This is equivalent to:

```
> c(1,2,3,4,5,6,7,8,9,10)
```

```
[1] 1 2 3 4 5 6 7 8 9 10
```

```
> 10:1
```

```
[1] 10 9 8 7 6 5 4 3 2 1
```

Beware of operator priority

```
> x <- 2*1:10
# equivalent to x <- 2*(1:10)
> x
[1] 2 4 6 8 10 12 14 16 18 20
> n <- 10
> 1:n-1
# equivalent to (1:n)-1
[1] 0 1 2 3 4 5 6 7 8 9
> 1:(n-1)
[1] 1 2 3 4 5 6 7 8 9
```

The seq() function: the same, but more flexible

```
> seq(from=1, to=10)
```

```
[1] 1 2 3 4 5 6 7 8 9 10
```

```
> seq(from=1, to=5, by=0.5)
```

```
[1] 1.0 1.5 2.0 2.5 3.0 3.5 4.0 4.5 5.0
```

```
> x <- seq(from=1, to=5, length=17)
```

```
> x
```

```
[1] 1.00 1.25 1.50 1.75 2.00 2.25 2.50 2.75
```

```
[9] 3.00 3.25 3.50 3.75 4.00 4.25 4.50 4.75
```

```
[17] 5.00
```

Non numeric vectors: boolean (logical) values

```
> x <- seq(from=1, to=5, length=17)
> x
[1] 1.00 1.25 1.50 1.75 2.00 2.25 2.50 2.75
[9] 3.00 3.25 3.50 3.75 4.00 4.25 4.50 4.75
[17] 5.00
> y <- x<5
> y
[1] TRUE TRUE TRUE TRUE TRUE TRUE
[7] TRUE TRUE TRUE TRUE TRUE TRUE
[13] TRUE TRUE FALSE
> sum(x<5)
[1] 16
```

Missing values are designated by NA

```
> z <- c(1:3,NA)
```

```
> z
```

```
[1] 1 2 3 NA
```

```
> is.na(z)
```

```
[1] FALSE FALSE FALSE TRUE
```

```
> mean(z)
```

```
[1] NA
```

```
> mean(z, na.rm=TRUE)
```

```
[1] 2
```

Character strings

```
> char <- c("hello", "world", "!"); char  
[1] "hello" "world" "!"
```

Vectors can not combine numbers and characters:

```
> char <- c("hello", 3:5, "world"); char  
[1] "hello" "3" "4" "5" "world"
```

```
> char <- c(char, NA); char  
[1] "hello" "3" "4" "5" "world" NA
```

Selecting subsets of vectors using []

```
> x <- 10:30
```

```
> x[2]
```

```
[1] 11
```

```
> x[1:5]
```

```
[1] 10 11 12 13 14
```

Selecting subsets of vectors using [] and boolean vectors

```
> x <- 10:30
> x[x>25]
[1] 26 27 28 29 30
> x <-c(seq(from=5, to=10,by=0.5),NA,
seq(from=11,to=15,by=0.5),NA,
seq(from=16,to=20,by=0.5))
> x[!is.na(x)]
[1] 5.0 5.5 6.0 6.5 7.0 7.5 8.0 8.5
[9] 9.0 9.5 10.0 11.0 11.5 12.0 12.5 13.0
[17] 13.5 14.0 14.5 15.0 16.0 16.5 17.0 17.5
[25] 18.0 18.5 19.0 19.5 20.0
```

Changing parts of vectors using []

```
> x[32] <- 200
```

```
> x[c(10,29)] <- c(1,100)
```

```
> x[x>15] <- NA
```

Finding the length of a vector

```
> x <- 1:5
```

```
> length(x)
```

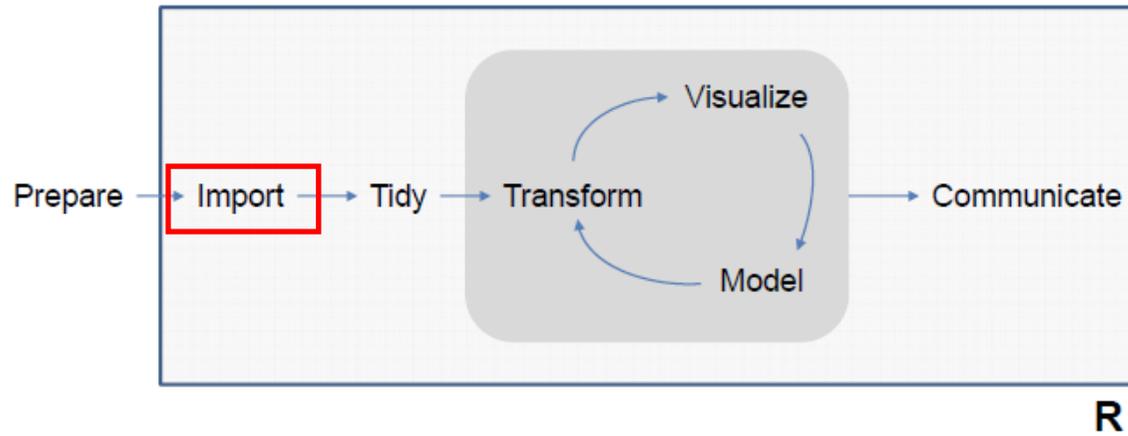

```
[1] 5
```

```
> y <- 1:16
```

```
> len <- length(y) ; len
```

```
[1] 16
```

Data analysis workflow

Adapted from Hadley Wickham

Importing data into R

- R can import flat files using e.g. the commands:

```
read.table()
```

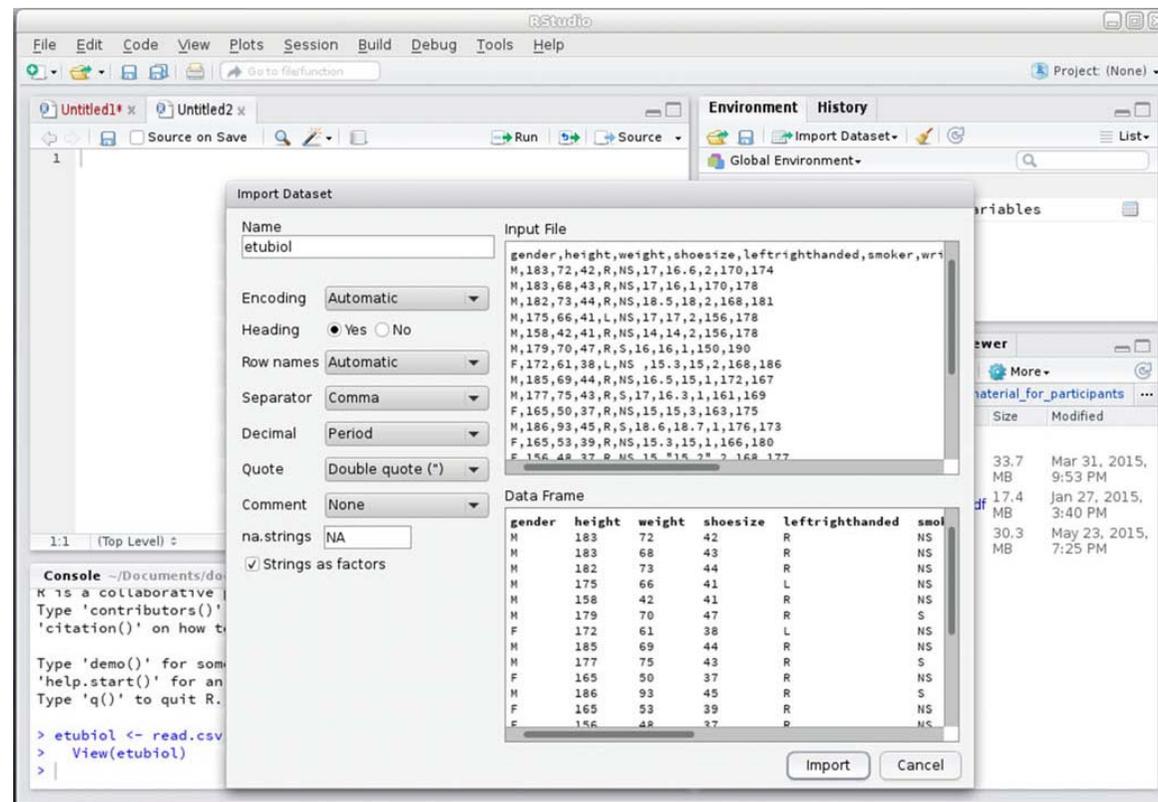

```
read.csv()
```

```
read.delim()
```

(with many options – check the help).

- R can also:

- Read Excel spreadsheets
- Read plenty of other formats
- Directly access databases
- Access files over the web

Data frames

- Data frames are made of columns having all the same number of elements
- They look like matrices, except that the columns can hold different variables types
- They are typically used to store data, with
 - Each row being an experimental unit
 - Each column being a measurement

```
> data[,1] # access first column
```

```
> data[, "data1"] # access column "data1"
```

```
> data$data1 # ... same
```

Creating data frames

```
> x <- 1:10
> y <- seq(from=5,to=10,length=10)
> z <- c("A","B","B","A","A","A","B","A","B","B")
> df <- data.frame(d1=x, d2=y, fact=z)
> df
  d1      d2 fact
1  1  5.000000  A
2  2  5.555556  B
..
> names(df)
[1] "d1" "d2" "fact"
> dim(df)
[1] 10  3
```

Adding new columns

```
> df$d3 <- 10:1
```

```
> df
```

```
  d1      d2 fact d3
1   1  5.000000   A 10
2   2  5.555556   B  9
```

```
...
```

```
> summary(df)
```

d1	d2	fact	d3
Min. : 1.00	Min. : 5.00	Length:10	Min. : 1.00
1st Qu.: 3.25	1st Qu.: 6.25	Class :character	1st Qu.: 3.25
Median : 5.50	Median : 7.50	Mode :character	Median : 5.50
Mean : 5.50	Mean : 7.50		Mean : 5.50
3rd Qu.: 7.75	3rd Qu.: 8.75		3rd Qu.: 7.75
Max. :10.00	Max. :10.00		Max. :10.00

Select data from a data frame

- Select all values of "d2" for which "fact" is "B"

```
> df[ df$fact == "B", "d2" ]
```

```
[1] 5.555556 6.111111 8.333333 9.444444 10.000000
```

- Select all values of "d1" for which "fact" is "B " and "d2" > 7

```
> df[ (df$fact == "B" & df$d2 > 7), "d1" ]
```

```
[1] 7 9 10
```

- Select all values of "d3" for which "fact" is "A " or "d2" < 6

```
> df[ (df$fact == "A" | df$d2 < 6), "d3" ]
```

```
[1] 10 9 8 4 2 1
```

```
> df
  d1      d2 fact d3
1  1 5.000000  A 10
2  2 5.555556  B  9
3  3 6.111111  B  8
4  4 6.666667  A  7
5  5 7.222222  A  6
6  6 7.777778  A  5
7  7 8.333333  B  4
8  8 8.888889  A  3
9  9 9.444444  B  2
10 10 10.000000 B  1
```
